

Quantities

Some interesting mineral deposits were recently here discovered in Saskatchewan. It is estimated that there is 10 per cent iron in pyrites, practically pure; sodium sulphite, bituminous coal and a high-grade brick red clay. There was also found a large deposit of oil. Some of the farmers who have filed claims with the Provincial Government covering these rights, have been recently awarded another phase of the potential of "oil-bearing" on the prairie.

Of the salt there is said to be enough to supply every table in Canada and to supply the needs of the farmer who holds the land—his own alkali has an exaggerated idea of what constitutes a fair division of the salt. It is estimated that there is a holding out for a long price.

The sodium sulphite, which has been discovered on the Hengstons, is estimated at about 6,000,000 tons.

almost inexhaustible. Overlying pyrites is a fine grade of brick-making clay. Sulphuric acid is made from iron pyrites and is worth about \$35 tons.

Andrews and Cruikshank, analytical chemists, who for several years have been working under the auspices of the Provincial Government, state that there is considerable interest being taken in the samples of minerals, salt and clay. British manufacturers are asking inquiries and seem to be alive to the possibilities of developing these sources. This interest is encouraged as giving promise of the required capital for development.

A Procession of Splendor

Phosphate Industry

Of Ocean Island

London Financiers Have A Plan Which Emphases Over 2,000 Hectares

Ocean Island, a tiny dot on the Pacific Ocean, only five miles in length, is the focus of a great deal of interest for its site, under the British flag, is a valuable phosphate deposit.

The island, which is a part of a vast deposit of exceedingly rich phosphate rock, was discovered in 1890 by a British naval officer, and a little before that phosphate, just the same, was found on the island.

They show that much to be the better known of the phosphate rock, which is the basis of the fertilizer industry. Total areas now stand at approximately 2,000 hectares.

With the increase of the phosphate rock, which is the basis of the fertilizer industry, the demand for phosphate has increased.

With the increase of the phosphate rock, which is the basis of the fertilizer industry, the demand for phosphate has increased.
